

# Trackintel case study

June 2, 2022

This notebook presents a case study to jointly analyse four different tracking datasets using Trackintel. Three of the datasets that are used in this case study can not be published to protect the privacy of the participants. You can find an executable example notebook for trackintel here: [binder](#) and [code](#).

## Imports

```
[305]: import os, sys
from collections import defaultdict
import pickle
import datetime

import numpy as np
import pandas as pd
import geopandas as gpd
import matplotlib.pyplot as plt
import pytz
import json
import seaborn as sns
from shapely.geometry import Point, Polygon
from sqlalchemy import create_engine

from IPython.display import Image
from IPython.core.display import HTML

import trackintel as ti
from trackintel.analysis.tracking_quality import temporal_tracking_quality
from trackintel.analysis.modal_split import calculate_modal_split
from trackintel.visualization.modal_split import plot_modal_split
from trackintel.analysis.labelling import predict_transport_mode
plt.rcParams.update({"font.size": 15})
```

## Define paths & PostGIS connection

```
[42]: # output directory to save all outputs
out_path = "temp"
os.makedirs(out_path, exist_ok=True)
```

```

# Geolife data
path_to_geolife = "Geolife Trajectories 1.3/Data"

# for postgis
DBLOGIN_FILE_GC = "../../dblogin_commit.json"
DBLOGIN_FILE_yumuv = "../../dblogin_mielab.json"

with open(DBLOGIN_FILE_GC) as json_file:
    LOGIN_DATA_GC = json.load(json_file)

with open(DBLOGIN_FILE_yumuv) as json_file:
    LOGIN_DATA_YUMUV = json.load(json_file)

engine_gc = create_engine(
    "postgresql://{}:{}@{}:{}{}".format(
        **LOGIN_DATA_GC
    )
)
engine_yumuv = create_engine(
    "postgresql://{}:{}@{}:{}{}".format(
        **LOGIN_DATA_YUMUV
    )
)

    "postgresql://{}:{}@{}:{}{}".format(
        **LOGIN_DATA_YUMUV
    )
)

CRS_WGS84 = "epsg:4326"

```

```

[30]: # short names of the four included datasets
studies = ["gc1", "gc2", "yumuv_graph_rep", "geolife"]

# Full names for plotting
study_mapping = {
    "gc1": "Green Class 1",
    "gc2": "Green Class 2",
    "yumuv_graph_rep": "Yumuv",
    "geolife": "Geolife",
}

```

## 1 Dataset loading and preprocessing

### 1.1 Datasets

We include the data from four tracking studies with two different tracking data types.

### 1.1.1 Green Class 1 & 2

The Green Class 1 & 2 studies were conducted in collaboration with the Swiss Federal Railway Systems (SBB) under the project name [SBB Green Class](#). In both studies, participants were given full access to all public transport in Switzerland. In addition, the participants from the first Green Class study (Green Class 1) received an electric vehicle and the ones from the second study (Green Class 2) an e-bike. Study participants were tracked with a GNSS-based application (app) that provides partially preprocessed data as staypoints and triplegs.

### 1.1.2 Geolife

The open-source [Geolife dataset](#) covers the movement of employees of Microsoft Research Asia. The dataset is from around 2012 and was still recorded with dedicated GPS-only trackers. As the study took place in an urban area the GPS was unreliable and there are many gaps in the dataset. However, Geolife is still one of the few publicly available tracking datasets.

### 1.1.3 Yumuv

The [yumuv](#) study investigated the impact of a [Mobility-as-a-Service app](#) that integrates shared e-scooters, e-bikes and public transport. In the yumuv study, participants were divided into control and treatment group and were tracked for three months using an app that already provides staypoints and triplegs.

### 1.1.4 Data import and preprocessing

One main advantage of trackintel is its ability to standardize the preprocessing of tracking data. For this, the different datasets have to be imported to geopandas dataframes that fulfill the requirements described on <https://trackintel.readthedocs.io/en/latest/modules/model.html>.

The trackintel data model consists of these different classes:

- positionfixes [pfs]: Raw GPS data.
- staypoints [sp]: Locations where a user spent a minimal time.
- triplegs [tpls]: Segments covered with one mode of transport.
- locations [loc]: Clustered staypoints.
- trips: Segments between consecutive activity staypoints (special staypoints that are not just waiting points).
- tours: Sequences of trips which start and end at the same location (if the column ‘journey’ is True, this location is home).

The Geolife dataset consists of only positionfixes while the other datasets are already processed to staypoints and triplegs by the tracking app. We will now import all datasets and combine them on the staypoints / triplegs level.

## 1.2 Import Geolife

Geolife is an important benchmark dataset. Trackintel therefore offers a dedicated function that reads in the Geolife dataset. The import function takes care of the required column format and names.

```
[24]: import trackintel
from trackintel.io.dataset_reader import read_geolife

pfs_geolife, _ = read_geolife(path_to_geolife, print_progress=True)
pfs_geolife[["user_id", "tracked_at", "geom", "elevation"]].head(3)
```

100%  
182/182 [01:18<00:00, 2.32it/s]

	user_id	tracked_at	geom	elevation
id				
7634985	0	2008-10-23 02:53:04+00:00	POINT (116.31842 39.98470)	149.9616
7634986	0	2008-10-23 02:53:10+00:00	POINT (116.31845 39.98468)	149.9616
7634987	0	2008-10-23 02:53:15+00:00	POINT (116.31842 39.98469)	149.9616

### 1.2.1 Geolife - Generate staypoints

We generate staypoints from the positionfixes and define all staypoints as relevant activities if they are longer than 25 minutes.

```
[26]: # extract staypoints
pfs_geolife, sp_geolife = pfs_geolife.as_positionfixes.generate_staypoints(
    gap_threshold=24 * 60,
    include_last=True,
    print_progress=True,
    dist_threshold=200,
    time_threshold=30,
    n_jobs=4,
)
sp_geolife["study"] = "Geolife"

# add activity flag to staypoints
sp_geolife = sp_geolife.as_staypoints.create_activity_flag(
    method="time_threshold", time_threshold=25
)
sp_geolife.head(3)
```

100%|  
182/182 [02:30<00:00, 1.21it/s]

	user_id	started_at	finished_at	elevation	geom	study	is_activity

## 1.3 Import Green Class 1 & 2

The green class datasets are stored in a postgis database and were already preprocessed to staypoints (static behavior) and triplegs (movement). To use them with trackintel, the data has to be adjusted to the data model. This means to create a geodataframe with the correct column names and timezone aware timestamps.

### 1.3.1 Green class - Staypoints

```
[35]: sp_gc = []
for study in ["gc1", "gc2"]:
    # download data
    sp_temp = gpd.GeoDataFrame.from_postgis(
        sql=f"""SELECT id, user_id, started_at, finished_at, geometry_raw,
            purpose_validated FROM {study}.staypoints\N
            where started_at <= finished_at""",
        con=engine_gc,
        geom_col="geometry_raw",
        index_col="id",
    )

    # transform to trackintel dataframe
    sp_temp = ti.io.read_staypoints_gpd(
        sp_temp,
        geom_col="geom",
        tz="UTC",
        crs=CRS_WGS84,
        mapper={"geometry_raw": "geom", "purpose_validated": "purpose"},
    )

    # green class specific definition of activities
```

```

sp_temp = sp_temp.as_staypoints.create_activity_flag(
    method="time_threshold", time_threshold=25
)
meaningful_purpose = ~sp_temp["purpose"].isin(["wait", "unknown"])
sp_temp.loc[meaningful_purpose, "is_activity"] = True

# keep study as attribute
sp_temp["study"] = study_mapping[study]

sp_gc.append(sp_temp)

# display output
print("Staypoints loaded successfully for GC1 and GC2.\\" 
      "Geometry not shown due to data protection.")
sp_temp.drop("geom", axis=1).head(3)

```

Staypoints loaded successfully for GC1 and GC2. Geometry not shown due to data protection.

[35]:	user_id	started_at	finished_at	purpose	is_activity	study
	id

### 1.3.2 Green class - Triplegs

```

[36]: tpls_gc = []
for study in ["gc1", "gc2"]:
    # download data using geopandas
    tpls_temp = gpd.GeoDataFrame.from_postgis(
        sql=f"""SELECT id, user_id, started_at, finished_at, mode_validated
               as mode, mode_validated as mode_detailed,
               geometry FROM {study}.triplegs where ST_isValid(geometry)""",
        con=engine_gc,
        crs=CRS_WGS84,
        geom_col="geometry",
        index_col="id",
    )
    # transform to trackintel dataframe
    tpls_temp = ti.io.read_triplegs_gpd(
        tpls_temp,
        geom_col="geom",
        crs=CRS_WGS84,
        tz="UTC",
        mapper={"geometry": "geom"},
    )
    # keep study as attribute
    tpls_temp["study"] = study_mapping[study]

```

```

tpls_gc.append(tpls_temp)

# display output
print("Triplegs loaded successfully for GC1 and GC2.\\" 
      "Geometry not shown due to data protection.")
tpls_temp.drop("geom", axis=1).head(3)

```

Triplets loaded successfully for GC1 and GC2. Geometry not shown due to data protection.

[36]:

## 1.4 Import yumuv

The yumuv data is stored in a postgis database and it is already available as staypoints and triplegs. To use them with trackintel, the data has to be adjusted to the data model. This means to create a geodataframe with the correct column names and timezone aware timestamps. We furthermore conduct two additional preprocessing steps:

- We filter the tracking duration to the duration of the study which took place for most users from the 13th of July 2020 to the 15th of November 2020.
- We offset the user ids by a constant to be able to combine the data later with the other datasets without overlaps.

### 1.4.1 yumuv - Staypoints

[37]:

```

min_date = datetime.datetime(year=2020, month=7, day=13, tzinfo=pytz.utc)
max_date = datetime.datetime(year=2020, month=11, day=15, tzinfo=pytz.utc)

```

[43]:

```

sp_yumuv = ti.io.read_staypoints_postgis(
    "select id, user_fk, started_at, finished_at, \
     geometry from yumuv.staypoint",
    con=engine_yumuv,
    geom_col="geometry",
    crs=CRS_WGS84,
    index_col="id",
    tz="UTC",
    mapper={"user_fk": "user_id"},
)
sp_yumuv = sp_yumuv.rename({"geometry": "geom"}, axis=1).set_geometry("geom")

sp_yumuv["study"] = "Yumuv"

# yumuv specific definition of activities
sp_yumuv = sp_yumuv.as_staypoints.create_activity_flag(time_threshold=25)

```

```

# offset user id to avoid conflicts with other studies
sp_yumuv["user_id"] = sp_yumuv["user_id"] + 10000

# filter study duration
sp_date_flag = (sp_yumuv["started_at"] >= min_date) & (
    sp_yumuv["finished_at"] <= max_date)
sp_yumuv = sp_yumuv[sp_date_flag]

# display output
print("Staypoints loaded successfully for Yumuv.\\" 
      "Geometry not shown due to data protection.")
sp_yumuv.drop("geom", axis=1).head(3)

```

Staypoints loaded successfully for Yumuv. Geometry not shown due to data protection.

[43]:

	user_id	started_at	finished_at	study	is_activity
id					
6773023	15529	2020-08-28 17:32:47+00:00	2020-08-29 10:56:01+00:00	Yumuv	True
6678616	15285	2020-08-22 12:23:03+00:00	2020-08-22 13:40:37+00:00	Yumuv	True
6109237	15003	2020-07-13 12:20:46+00:00	2020-07-13 12:57:39+00:00	Yumuv	True

#### 1.4.2 yumuv - Triplegs

[44]:

```

tpls_yumuv = ti.io.postgis.read_triplegs_postgis(
    """select distinct on (id) id, user_fk, started_at,
    finished_at, track_mode_corrected,
    geometry FROM yumuv.tripleg where ST_isvalid(geometry)""",
    con=engine_yumuv,
    geom_col="geometry",
    crs=CRS_WGS84,
    index_col="id",
    tz="UTC",
    mapper={"user_fk": "user_id"},
)
tpls_yumuv = tpls_yumuv.rename(
    {"geometry": "geom", "track_mode_corrected": "mode"}, axis=1
).set_geometry("geom")
tpls_yumuv["study"] = "Yumuv"

# offset user id
tpls_yumuv["user_id"] = tpls_yumuv["user_id"] + 10000

# filter study duration
tpls_date_flag = (tpls_yumuv["started_at"] >= min_date) & (
    tpls_yumuv["finished_at"] <= max_date
)

```

```

)
tpls_yumuv = tpls_yumuv[tpls_date_flag]

# display output
print("Triplegs loaded successfully for Yumuv.\\" 
      "Geometry not shown due to data protection.")
tpls_yumuv.drop("geom", axis=1).head(3)

```

Triplegs loaded successfully for Yumuv. Geometry not shown due to data protection.

---

## 1.5 Combine studies

All datasets are now loaded into the trackintel framework and all tracking data is represented as **staypoints** and **triplegs**. We can now represent all studies in a joint **staypoints** and a joint **triplegs** dataframe and process all studies jointly. To allow the joint analysis we have to perform the following steps:

- All staypoints and triplegs are combined in a single dataframe respectively.
- All user ids are represented as strings to have an id column with a single data type.
- We offset the ids of staypoints and triplegs so that they are unique across studies.

Furthermore we simplify the geometry of triplegs to reduce computation time.

### 1.5.1 All studies - combine staypoints

---

```
[45]: staypoints = pd.concat([sp_geolife] + sp_gc + [sp_yumuv])
staypoints["user_id"] = staypoints["user_id"].astype(str)
```

---

### 1.5.2 All studies - combine triplegs

---

```
[46]: triplegs = pd.concat([tpls_geolife] + tpls_gc + [tpls_yumuv])
triplegs["user_id"] = triplegs["user_id"].astype(str)
```

---

---

```
[47]: triplegs["geom"] = triplegs.simplify(1e-5, preserve_topology=False)
```

---

### 1.5.3 Offset ids to ensure unique IDs

---

```
[49]: for ix, study in enumerate(study_mapping.values()):
    sp_study_flag = staypoints["study"] == study
    tpls_study_flag = triplegs["study"] == study
```

---

```

staypoints.loc[sp_study_flag].index = staypoints.loc[
    sp_study_flag].index + ix * 10e7
triplegs.loc[tpls_study_flag].index = triplegs.loc[
    tpls_study_flag].index + ix * 10e7

```

[50]: # show a staypoint for each study (without user\_id and geometry due to privacy)

```

staypoints[[
    "started_at", "finished_at", "study", "is_activity", "purpose"
]].groupby("study").head(1)

```

[50]:

	started_at	finished_at	study	is_activity	purpose
id					
0	2008-10-23 03:03:45+00:00	2008-10-23 04:08:07+00:00	Geolife	True	None
3552473	2017-08-17 17:22:12+00:00	2017-08-17 18:04:00+00:00	Green Class 2	True	home
6309557	2020-07-28 11:23:02+00:00	2020-07-28 13:22:05+00:00	Yumuv	True	None
1321494	2016-11-23 07:27:13.687000+00:00	2016-11-23 07:51:43.687000+00:00	Green Class 1	True	work

Finally we create a table that matches user ids to studies

[51]:

```

user_study_matching = staypoints[["user_id", "study"]].drop_duplicates()
user_study_matching = user_study_matching.set_index("user_id")

```

## 1.6 Joint preprocessing - Trips, tours and locations

The representation of human mobility as `staypoints` and `triplegs` is often not enough for a detailed analysis. We now use trackintel to process `staypoints` and `triplegs` further into `trips`, `tours` and `locations`.

### 1.6.1 Create trips

[52]:

```

staypoints, triplegs, trips = ti.preprocessing.triplegs.generate_trips(
    staypoints=staypoints, triplegs=triplegs,
    gap_threshold=15, add_geometry=True
)

```

[53]:

```

trips = trips.join(user_study_matching, on="user_id")

```

[60]:

```

trips.head(3)

```

[60]:

	user_id	started_at	finished_at	geom	origin_staypoint_id	destination_staypoint_id	study	tour_id	duration_s	
id										
0	0	2008-10-23 02:53:04+00:00	2008-10-23 03:03:40+00:00	MULTIPOINT (116.31842 39.98470, 116.29917 39.9...	NaN		0.0	Geolife	NaN	0.176667
1	0	2008-10-23 04:08:07+00:00	2008-10-23 04:32:47+00:00	MULTIPOINT (116.29917 39.98341, 116.32451 39.9...	0.0		1.0	Geolife	NaN	0.411111
2	0	2008-10-23 09:42:25+00:00	2008-10-23 11:10:37+00:00	MULTIPOINT (116.32451 39.99967, 116.32105 40.0...	1.0		2.0	Geolife	NaN	1.470000

### 1.6.2 Create locations

[54]:

```

staypoints, locations = ti.preprocessing.generate_locations(
    staypoints,
    epsilon=30,
    num_samples=1,
)

```

```

        distance_metric="haversine",
        print_progress=True,
        n_jobs=4,
)

```

100%  
1172/1172 [00:13<00:00, 89.58it/s]

[55]: locations = locations.join(user\_study\_matching, on="user\_id")

[59]: locations.head(3)

## 2 Dataset comparison

### 2.1 Simple Statistics

Number of users, number of trips, number of trips by user, etc

[61]: overview\_df = pd.DataFrame(index=study\_mapping.values())
overview\_df["nr\_user"] = staypoints.groupby(by=["study"]).agg(
 {"user\_id": "nunique"}
)
nr\_user = overview\_df["nr\_user"]

```

# nb staypoints
overview_df["nr_sp"] = staypoints.groupby(by=["study"]).size()
overview_df["nr_staypoints_per_user"] = overview_df["nr_sp"] / nr_user

# nb triplexes
overview_df["nr_tpls"] = triplexes.groupby(by=["study"]).size()
overview_df["nr_triplexes_per_user"] = overview_df["nr_tpls"] / nr_user

# nb trips
overview_df["nr_trips"] = trips.groupby(by=["study"]).size()
overview_df["nr_trips_per_user"] = overview_df["nr_trips"] / nr_user
# nb locations

overview_df["nr_loc"] = locations.groupby(by=["study"]).size()
overview_df["nr_locations_per_user"] = overview_df["nr_loc"] / nr_user

# nb tours
overview_df["nr_tours"] = tours.groupby(by=["study"]).size()
overview_df["nr_tours_per_user"] = overview_df["nr_tours"] / nr_user

```

[62]: overview\_df

[62]:

	nr_user	nr_sp	nr_staypoints_per_user	nr_tpls	nr_triplexes_per_user	nr_trips	nr_trips_per_user

## 2.2 Trip characteristics

- How many trips comprise one tour on average? How many triplexes comprise a trip?
- What is the average trip duration / distance?

### 2.2.1 Number of hops in tours

[63]: tours["nb\_hops"] = tours["trips"].apply(lambda x: len(x))  
overview\_df["avg\_hops\_tours"] = tours.groupby("study")["nb\_hops"].mean()

[64]: overview\_df["avg\_hops\_tours"]

[64]: Green Class 1 2.725197  
Green Class 2 2.656656  
Yumuv 2.112806  
Geolife 2.373469  
Name: avg\_hops\_tours, dtype: float64

## 2.2.2 Trip duration

```
[65]: trips["duration_s"] = (
    trips["finished_at"] - trips["started_at"]
).dt.total_seconds() / 3600

[66]: overview_df[["mean_trip_dur", "std_trip_dur"]] = trips.groupby(
    "study"
)[["duration_s"]].aggregate(["mean", "std"])

[67]: overview_df[["mean_trip_dur", "std_trip_dur"]]
```

```
[67]:      mean_trip_dur  std_trip_dur
Green Class 1      0.522175    0.731360
Green Class 2      0.513715    0.753746
Yumuv              0.681057    0.911373
Geolife             0.640133    0.935874
```

## 2.2.3 Overall tracking period

```
[68]: min_max_times_by_user = trips.groupby(["study", "user_id"]).aggregate(
    {"started_at": "min", "finished_at": "max"}
)
duration_by_user = (
    min_max_times_by_user[
        "finished_at"
    ] - min_max_times_by_user["started_at"]
).dt.total_seconds() / (3600 * 24)

overview_df[
    ["mean_tracking_period", "std_tracking_period"]
] = duration_by_user.groupby("study").aggregate(["mean", "std"])

[69]: overview_df[["mean_tracking_period", "std_tracking_period"]]
```

```
[69]:      mean_tracking_period  std_tracking_period
Green Class 1          401.639038    59.289224

### 2.3.2 Present the trip statistics as nice table

```
[268]: # Analysis table
df_detailed = overview_df[
    [
        "nr_trips_per_user_per_day",
        "mean_trip_dur",
        "std_trip_dur",
        "avg_hops_tours",
        "nr_legs_per_trip",
        "avg_trip_length",
        "std_trip_length",
        "mean_tracking_quality",
        "std_tracking_quality",
    ]
]

df_detailed = df_detailed.round(2)
```

```
[271]: # # format mean and its std nicely in a single cell
to_km = lambda x: (x/1000).round(1)
df_detailed["Trip distance (std)"] = df_detailed.apply(
    lambda x: f"{to_km(x['avg_trip_length'])} ({to_km(x['std_trip_length'])})", axis=1
)
df_detailed["Trip duration (std)"] = df_detailed.apply(
    lambda x: f"{x['mean_trip_dur']} ({x['std_trip_dur']})", axis=1
)
df_detailed["Tracking quality (std)"] = df_detailed.apply(
    lambda x: f"{x['mean_tracking_quality']} ({x['std_tracking_quality']})", axis=1
)
```

```
[272]: df_detailed = df_detailed.rename(
    columns={
        "nr_trips_per_user_per_day": "Trips per day",
        "avg_hops_tours": "Trips per tour",
        "nr_legs_per_trip": "Legs per trip",
    }
)
df_detailed.drop(
    [

        "std_trip_length",
        "mean_tracking_quality",
        "std_tracking_quality",
        "mean_trip_dur",
    ]
```

```

        "std_trip_dur",
],
axis=1,
inplace=True,
)

df_detailed

```

[272] :

	Trips per day	Trips per tour	Legs per trip	Trip distance (std)	Trip duration (std)	Tracking quality (std)
Green Class 1	4.32	2.73	1.92	27.4 (478.7)	0.52 (0.73)	0.85 (0.17)
Green Class 2	3.80	2.66	2.09	33.7 (568.2)	0.51 (0.75)	0.75 (0.24)
Yumuv	3.13	2.11	2.51	16.9 (100.4)	0.68 (0.91)	0.77 (0.23)
Geolife	1.70	2.37	1.00	36.1 (3163.5)	0.64 (0.94)	0.4 (0.32)

## 2.4 KDE plot for user tracking quality distribution

We have calculated the temporal coverage of the tracking data as an indicator for the tracking quality. The indicator was calculted for every individual user. We'll now plot the distribution over users for each dataset.

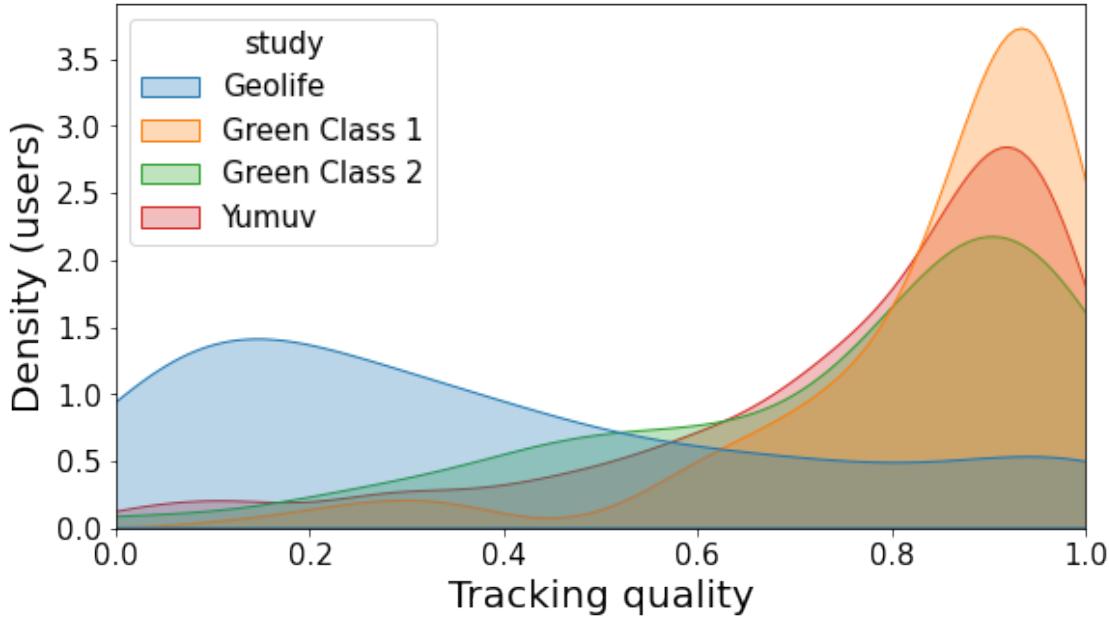

[90]:

```
# pivot to match seaborn requirements
tracking_quality_df = tracking_quality_by_user_study.reset_index(
    level=0
).pivot(columns="study", values="quality")
```

[230]:

```
fig, ax = plt.subplots(figsize=(9, 5))
g = sns.kdeplot(
    data=tracking_quality_df,
    fill=True,
    alpha=0.3,
    legend=True,
    common_grid=True,
    common_norm=False,
    ax=ax,
)

plt.ylabel("Density (users)", fontsize=20)
plt.xlabel("Tracking quality", fontsize=20)
sns.move_legend(g, "upper left")
plt.xlim(0, 1)
plt.savefig(os.path.join(out_path, "tracking_quality_kde.pdf"))
plt.show()
```

## 2.5 Modal split dataset comparison

We'll now show how trackintel can be used to analyze the modal split and compare it between different studies using the trackintel function `calculate_modal_split`. The datasets GC1, GC2 & yumuv have mode labels available while geolife does not feature mode labels for all triplegs. We therefore use the trackintel function `predict_transport_mode` to create labels.

Another preprocessing step is required because all studies use different mode labels. All of them will be matched to the three categories `fast`, `motorized` and `slow`

```
[96]: # Fill transport mode for geolife
is_geolife = triplegs["study"] == "Geolife"
triplegs.loc[is_geolife, "mode"] = predict_transport_mode(triplegs[is_geolife])
```

```
[97]: # we need to map the mode labels from GC1, GC2 & Yumuv to the ones from geolife
mode_to_category = {
    "Mode::Airplane": "fast",
    "Mode::Train": "fast",
    "airplane": "fast",
    "fast_mobility": "fast",
    "fast": "fast",
    "car": "motorized",
    "Mode::Boat": "slow",
    "Mode::Bus": "motorized",
    "Mode::Car": "motorized",
    "Mode::Coach": "motorized",
    "Mode::Ecar": "motorized",
```

```

"Mode::Tram": "motorized",
"bus": "motorized",
"coach": "motorized",
"ecar": "motorized",
"motorbike": "motorized",
"tram": "motorized",
"motorized_mobility": "motorized",
"motorized": "motorized",
"Mode::Bicycle": "slow",
"Mode::Ebicycle": "slow",
"Mode::Walk": "slow",
"bicycle": "slow",
"boat": "slow",
"ebicycle": "slow",
"kick_scooter": "slow",
"ski": "slow",
"train": "fast",
"walk": "slow",
"slow": "slow",
"slow_mobility": "slow",
}

# change mode labels with the above mapping
triplegs["mode"] = triplegs["mode"].map(mode_to_category)
triplegs.dropna(subset=["mode"], inplace=True)
triplegs["mode"].unique()

```

[97]: array(['slow', 'motorized', 'fast'], dtype=object)

### 2.5.1 Get modal split by count, duration and distance

```

[98]: # count
modal_split_count = triplegs.groupby("study").apply(
    calculate_modal_split, metric="count", norm=True
)
modal_split_count = modal_split_count.droplevel(1)
modal_split_count

```

	mode	fast	motorized	slow

```
), bbox_inches="tight")
plt.show()
```

```
[246]: # create plot for all modal split types
for split_type, modal_split_df in zip(
    ["count", "duration", "distance"],
    [modal_split_count, modal_split_duration, modal_split_distance],
):
    plot_modal_split_comparison(split_type, modal_split_df)
```

## 2.6 Home / Work labeling

In this section trackintel is used to analyze the activity patterns of participants of the different datasets. In the Green Class 1&2 datasets, the activity labels were provided by the participants. To analyze all datasets we'll first infer the major activity labels in the Geolife and yumuv dataset using the trackintel method `location_identifier`.

### 2.6.1 Compute staypoint purpose for Geolife and Yumuv

```
[106]: yumuv_geolife_flag = staypoints["study"].isin(["Geolife", "Yumuv"])

staypoints.loc[yumuv_geolife_flag, "purpose"] = ti.analysis.location_identifier(
    staypoints.loc[yumuv_geolife_flag], pre_filter=False
) ["purpose"]
```

### 2.6.2 Select work or home for analysis

In the following we will analyze the distribution of home or work activity staypoints over time. To chose the analysis, the variable `home_work_variable` is either set to “home” or “work”

```
[327]: # Choose to analyze "home" or "work" activity staypoints
home_work_variable = "home"
```

### 2.6.3 Data preparation for plotting

```
[328]: # Use either the home staypoints or the work staypoints
if home_work_variable == "home":
    sp_study = staypoints[staypoints["purpose"] == "home"].copy()
elif home_work_variable == "work":
    sp_study = staypoints[staypoints["purpose"] == "work"].copy()
```

```
[329]: # convert timestamp columns
sp_study.loc[:, "started_at"] = sp_study.loc[
    :, "started_at"].dt.tz_convert("Europe/Paris")
sp_study.loc[:, "finished_at"] = sp_study.loc[
    :, "finished_at"].dt.tz_convert("Europe/Paris")
```

### 2.6.4 Data transformation

To create a nice plot, we calculate the density of home or work staypoints in every minute bin. For this the staypoints are resampled with a minute resolution and then later aggregated again.

```
[330]: # chop up durations to minute-by-minute time series
sp_study = sp_study[["started_at", "finished_at", "study"]]

# create a column that contains date ranges with minute resolution
sp_study["date"] = sp_study.apply(
    lambda x: pd.date_range(
        x["started_at"], x["finished_at"], freq="min")
```

```

    , axis=1
)
sp_study_expl = sp_study.explode("date", ignore_index=True).drop(
    columns=["started_at", "finished_at"]
)

```

[331]: # create hour & minute attributes used for aggregation later.  
# Get Geolife in local time zone  
geolife\_flag = sp\_study\_expl["study"] == "Geolife"  
sp\_study\_expl.loc[~geolife\_flag, "hour"] = sp\_study\_expl.loc[  
 ~geolife\_flag, "date"]
].dt.hour  
sp\_study\_expl.loc[geolife\_flag, "hour"] = sp\_study\_expl.loc[  
 geolife\_flag, "date"]
].dt.tz\_convert("Asia/Shanghai").dt.hour  
sp\_study\_expl["minute"] = sp\_study\_expl.date.dt.minute  
sp\_study\_expl["day"] = sp\_study\_expl.date.dt.date  
sp\_study\_expl.head(3)

[331]:

	study	date	hour	minute	day
0	Geolife	2009-03-30 08:20:40+02:00	14.0	20	2009-03-30
1	Geolife	2009-03-30 08:21:40+02:00	14.0	21	2009-03-30
2	Geolife	2009-03-30 08:22:40+02:00	14.0	22	2009-03-30

[332]: # aggregate by hour and minute of every day for every study  
count\_by\_minute = pd.DataFrame(sp\_study\_expl.groupby(  
 ["study", "day", "hour", "minute"])
).size().rename({0: "nr\_home\_sp"}, axis=1)

[333]: count\_by\_minute.reset\_index(inplace=True)  
count\_by\_minute["minute\_of\_day"] = count\_by\_minute[  
 "hour"] \* 60 + count\_by\_minute["minute"]
count\_by\_minute.head(3)

[333]:

	study	minute_of_day	users_at_home
0	Geolife	0.0	0.520938
1	Geolife	1.0	0.520791
2	Geolife	2.0	0.520882

[334]: count\_by\_minute.tail(3)

[334]:

	study	minute_of_day	users_at_home
5757	Yumuv	1437.0	0.676193
5758	Yumuv	1438.0	0.676623
5759	Yumuv	1439.0	0.677077

## 2.6.5 Normalize: Fraction of users at home/work for each minute

```
[335]: # Get the active number of users per day
active_users_per_day = staypoints.set_index("started_at").groupby(
    ["study", "user_id", pd.Grouper(freq="D")])
).size().reset_index()
active_users_per_day["day"] = active_users_per_day["started_at"].dt.date
active_users_per_day = active_users_per_day.groupby(
    ["study", "day"])
).size().reset_index().rename({0:"active_users"}, axis=1)
active_users_per_day.head(3)
```

	study	day	active_users
0	Geolife	2007-04-12	3
1	Geolife	2007-04-13	4
2	Geolife	2007-04-14	3

```
[336]: count_by_minute = count_by_minute.merge(
    active_users_per_day, left_on=["study", "day"],
    right_on=["study", "day"])
)
```

```
[337]: # compute the number of users at home per day
count_by_minute["users_at_home"] = count_by_minute[
    "nr_home_sp"] / count_by_minute["active_users"]
```

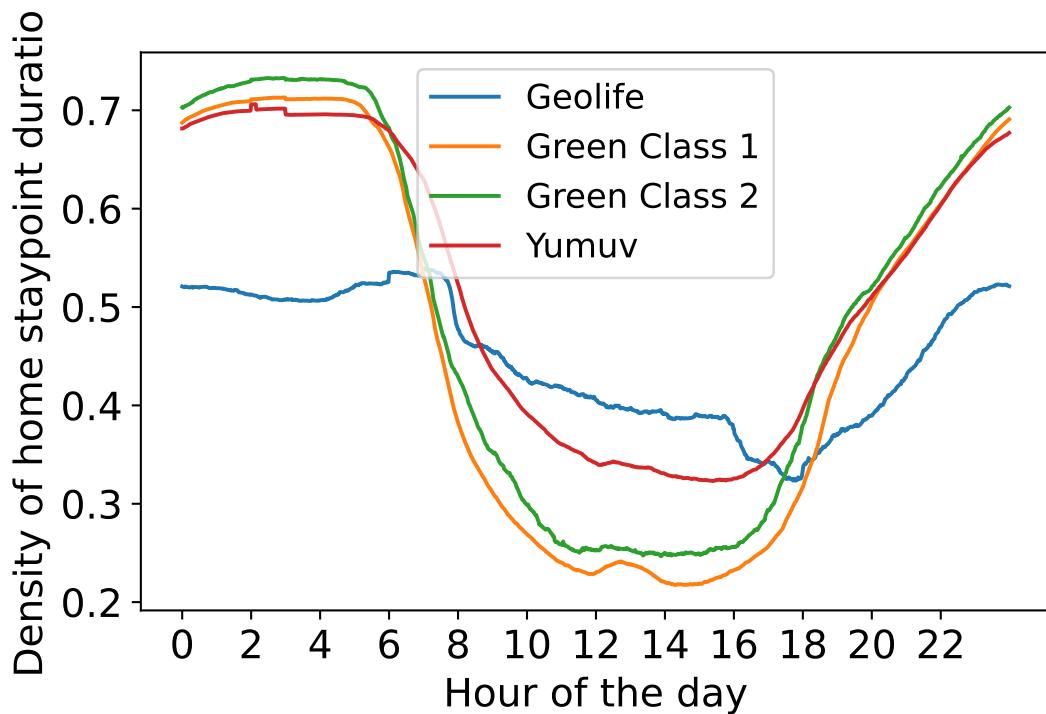

```
[338]: # Aggregate over the days to get the average fraction of users at home
count_by_minute = count_by_minute.groupby(
    ["study", "minute_of_day"])
).agg({"users_at_home": "mean"}).reset_index()
```

## 2.6.6 Plotting

```
[339]: # reshape and normalize so that we can plot easily
count_by_minute_pivot = count_by_minute.pivot_table(
    columns="study", index="minute_of_day", values="users_at_home")
)
count_by_minute_pivot.head(3)
```

study	Geolife	Green Class 1	Green Class 2	Yumuv
minute_of_day				
0.0	0.520938	0.687393	0.702919	0.681459

`plot_work_home_labels("work", count_by_minute_pivot)`

## 2.7 Visualization for individual users - Tracking data

Trackintel can also be used to visualize tracking data of individual users

### 2.7.1 Data collection

```
[275]: x_min = 116.2
x_max = 116.5
y_min = 39.8
y_max = 40.1
sw = Point(x_min, y_min)
se = Point(x_max, y_min)
ne = Point(x_max, y_max)
nw = Point(x_min, y_max)

study_area = gpd.GeoDataFrame(
    columns=["geometry"],
    data=[Polygon([sw, se, ne, nw])],
    geometry="geometry",
    crs="EPSG:4326",
)
```

```
[276]: # Load Geolife data of one user
tpls_vis = triplegs[triplegs["user_id"] == "51"].copy()
tpls_vis = ti.preprocessing.filter.spatial_filter(
    tpls_vis, study_area, method="within"
)
```

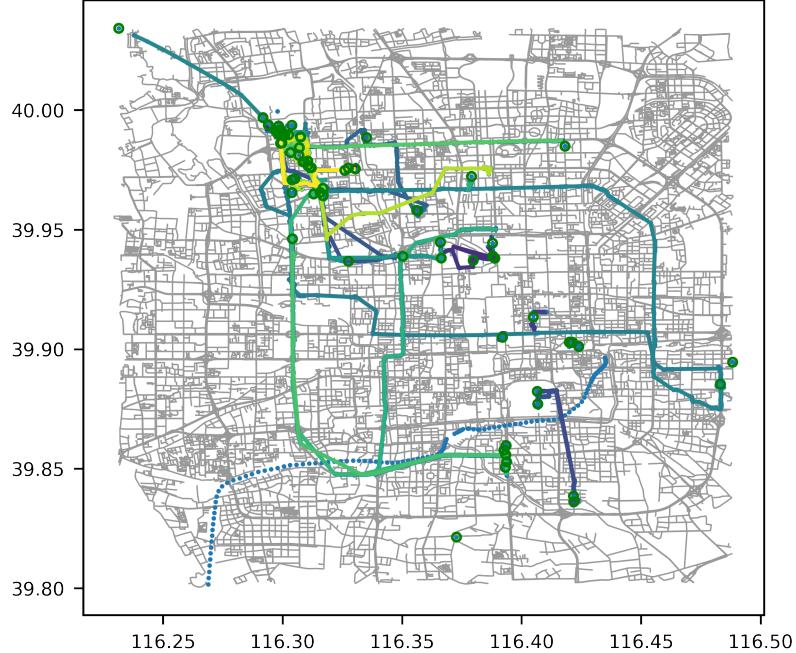

```
[277]: # Get staypoints as well for this user
sp_vis = staypoints[staypoints["user_id"] == "51"].copy()
sp_vis = ti.preprocessing.filter.spatial_filter(
    sp_vis, study_area, method="within"
)
```

```
[278]: # Get positionfixes for this user -
# using the pfs obtained with read_geolife function (see top of notebook)
pfs_vis = pfs_geolife[pfs_geolife["user_id"] == 51]
pfs_vis = ti.preprocessing.filter.spatial_filter(
    pfs_vis, study_area, method="within"
)
```

## 2.7.2 Plot all tracking data

```
[279]: ti.visualization.plot_triplegs(
   tpls_vis,
    staypoints=sp_vis,
    plot_osm=True,
    positionfixes=pfs_vis,
    staypoints_radius=150,
    out_filename=os.path.join(out_path, "geolife_tpls_sp_pfs"),
)
Image(filename=os.path.join(
    out_path, "geolife_tpls_sp_pfs.png"
), width=600, height=600)
```

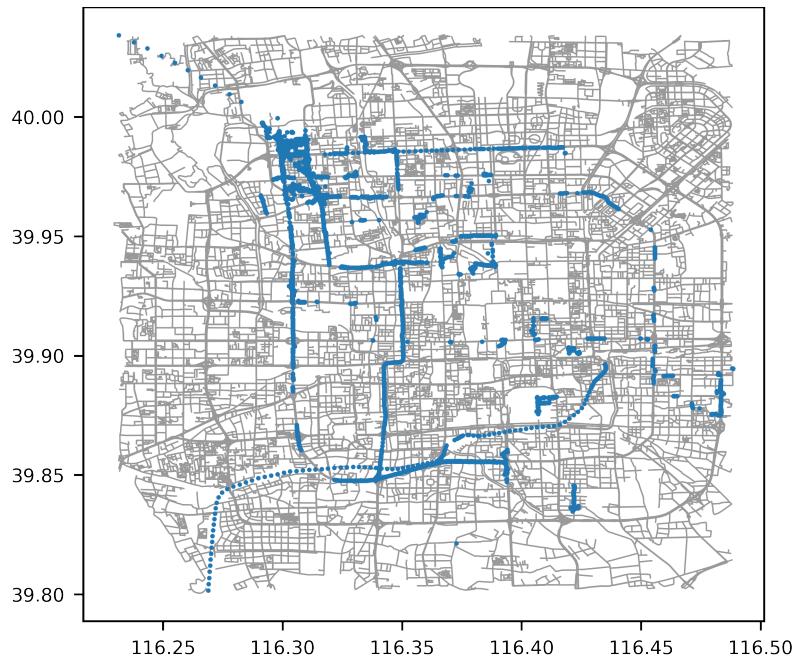

```
[279] :
```

### 2.7.3 Plot only positionfixes

```
[280]: ti.visualization.plot_positionfixes(  
    pfs_vis, plot_osm=True, out_filename=os.path.join(out_path, "geolife_pfs"))  
)  
Image(  
    filename=os.path.join(out_path, "geolife_pfs.png"), width=500, height=500  
)
```

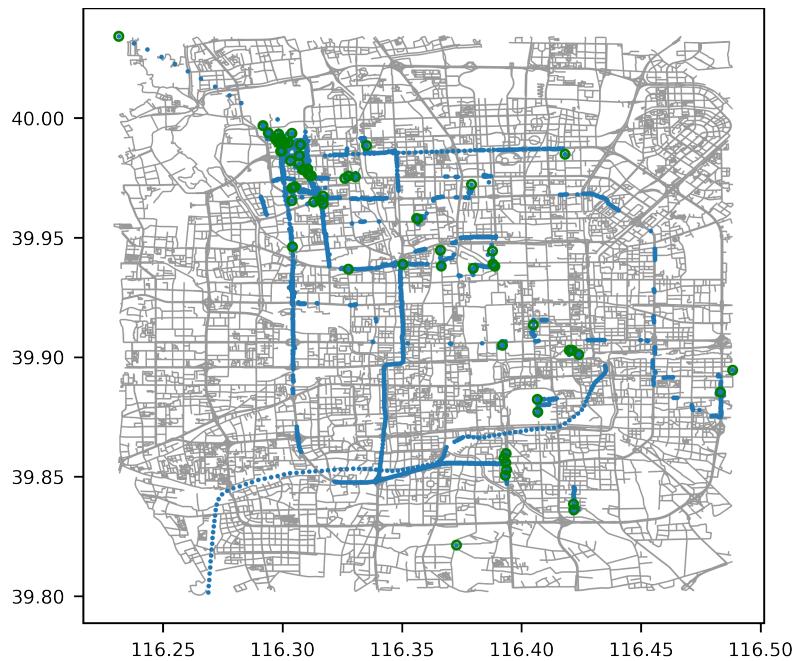

[280]:

### 2.7.4 Plot staypoints with positionfixes

```
[281]: ti.visualization.plot_staypoints(  
    sp_vis,  
    positionfixes=pfs_vis,  
    plot_osm=True,  
    radius=150,  
    out_filename=os.path.join(out_path, "geolife_sp_pfs")),  
)  
Image(filename=os.path.join(  
    out_path, "geolife_sp_pfs.png"  
) , width=500, height=500)
```

[281]:

## 2.8 Visualization of individual users - Modal split

```
[282]: # Use one GC2 user for this visualization
tpls_vis = triplegs[
    triplegs["user_id"] == "c9aa08e2-1a5d-4d41-ae62-6110a9072b23"
].copy()
```

```
[283]: # rename to mode
tpls_vis["mode"] = tpls_vis["mode_detailed"]
```

### 2.8.1 Modal split - by count

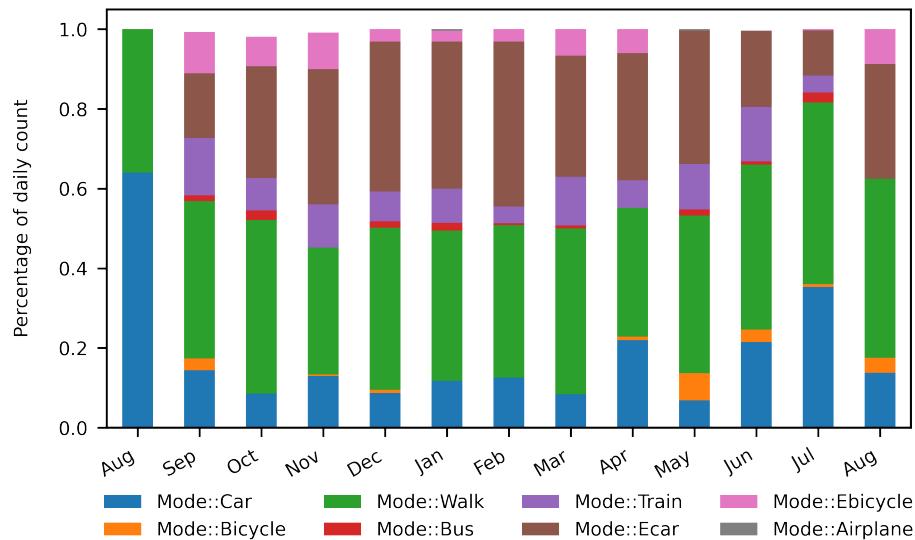

```
[284]: # compute modal split
modal_split = calculate_modal_split(
    tpls_vis, freq="M", metric="count", per_user=False, norm=True
)
```

```
[285]: # order the transport modes for colour choices
column_order = [
    "Mode::Car",
    "Mode::Bicycle",
    "Mode::Walk",
    "Mode::Bus",
    "Mode::Train",
    "Mode::Ecar",
    "Mode::Ebicycle",
```

```

        "Mode::Airplane",
]
modal_split = modal_split[column_order]
```

```
[286]: fig, ax = plt.subplots(figsize=(5, 3))
ax = ti.visualization.modal_split.plot_modal_split(
    modal_split,
    date_fmt_x_axis="%b",
    y_label="Percentage of daily count",
    skip_xticks=0,
    n_col_legend=4,
    fig=fig,
    axis=ax,
    borderaxespad=2,
)
# fig.autofmt_xdate()
plt.savefig(os.path.join(out_path, "modal_split_count"))
```

## 2.8.2 Modal split - by distance

```
[287]: modal_split = calculate_modal_split(
   tpls_vis, freq="M", metric="distance", per_user=False, norm=True
)
modal_split = modal_split[column_order]
```

```
[288]: fig, ax = plt.subplots(figsize=(5, 3))
ax = ti.visualization.modal_split.plot_modal_split(
    modal_split,
```

```

date_fmt_x_axis="%b",
y_label="Percentage of daily distance",
skip_xticks=0,
n_col_legend=4,
fig=fig,
axis=ax,
borderaxespad=2,
)
# fig.autofmt_xdate()
plt.savefig(os.path.join(out_path, "modal_split_distance"))

```
